

Ballinger Homes: Hot and Cold Potable System Rehabilitation

Location: Seattle, Washington

Date of Completion: September 1993

Situation:

The galvanized steel domestic hot and cold potable water system experienced leaks, corrosion, low flow and red water. The pipes are located under the floors and parking lots, so a re-pipe would not only be messy and disruptive, but it would be very expensive and time-consuming.

Solution:

American Pipe Lining, a Nu Flow company, applied an epoxy coating to all of the potable water lines and the pipes have not experienced failures since. Our no-dig solution was about 50% of the cost of a re-pipe, so the customer was very pleased to save money, time and hassle.
