

## Sudbury Hospital: Proactive Drain System Protection Using Epoxy Coating

Location: Sudbury, Ontario, Canada

### Situation:

146 vertical and horizontal copper drain lines, more than half a mile in length, were recently installed in the hospital's new wing and laboratory. The customer asked Nu Flow to line the drain pipes to prevent future problems, because the lab routinely pours corrosive chemicals down the drains.

### Solution:

Although Nu Flow usually lines drains with our Pull-in-Place structural liner, our technicians decided the best solution was our blown-in epoxy to create a protective coating inside the pipes. Our patented epoxy will minimize pipe corrosion and extend the drain system's life, saving the customer money.
